

Designation: C307 – 23

Standard Test Method for Tensile Strength of Chemical-Resistant Mortar, Grouts, and Monolithic Surfacing¹

This standard is issued under the fixed designation C307; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the U.S. Department of Defense.

1. Scope

1.1 This test method covers the determination of tensile strength of cured chemical-resistant materials in the form of molded briquets. These materials include mortars, brick and tile grouts, machinery grouts, and monolithic surfacings. These materials shall be based on resin, silicate, silica, or sulfur binders.

1.2 The values stated in inch-pound units are to be regarded as standard. The values given in parentheses are mathematical conversions to SI units that are provided for information only and are not considered standard.

1.3 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety, health, and environmental practices and determine the applicability of regulatory limitations prior to use.*

1.4 *This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.*

E177 Practice for Use of the Terms Precision and Bias in ASTM Test Methods

E691 Practice for Conducting an Interlaboratory Study to Determine the Precision of a Test Method

3. Terminology

3.1 *Definitions:*

3.1.1 For definitions of terms used in this test method, see Terminology **C904**.

4. Significance and Use

4.1 It is recognized that chemical-resistant mortars, grouts, and monolithic surfacings are not usually under tension when in service; however, such data are useful for purposes of determining the rate of cure and other properties.

4.2 This test method is not recommended for mortars, grouts, and monolithic surfacings containing aggregate greater than 1/4 in.

5. Apparatus

5.1 *Weighing Equipment*, shall be capable of weighing materials or specimens to $\pm 0.3\%$ accuracy.

5.2 *Specimen Molds*—The molds for making briquet test specimens shall be sufficiently rigid to prevent deformation during molding and shall be made of corrosion-resistant material. Gang molds, when used, shall be of the type shown in **Fig. 1**. The dimensions of the briquet molds shall be the width of the mold, between inside faces, at waist line of briquet, 1 in. The width and the depth of the briquet mold at the waist line shall be 1 in. ± 0.02 in. (25 mm ± 0.5 mm). The molds shall conform to the dimensional requirements shown in **Fig. 2**.

5.3 *Equipment for Mixing Materials*, shall consist of a container of suitable size, preferably corrosion resistant, and a strong, sturdy spatula, trowel, or mechanical mixer.

FIG. 1 Briquet Gang Mold

FIG. 2 Briquet Specimens for Tensile Strength Test

5.4 The following additional equipment is required for sulfur mortars.

5.4.1 *Melting Chamber*, of sufficient volume and heat capacity to melt the mortar sample and maintain the temperature of the melt between 260 °F and 290 °F (127 °C and 143 °C).³

5.4.2 *Laboratory Mixer*, of such a type and speed to be capable of lifting the aggregate without beating air into the melt.

5.4.3 *Ladle*, of sufficient capacity to completely pour one briquet.

5.5 *Testing Machine*, the testing machine shall be of any type sufficient to provide the required load and the rate of crosshead movement prescribed. It shall have been verified to have an accuracy of 1.0 % or better within 12 months of the time of use in accordance with Practices E4.

5.6 *Tension Clips*, for holding the tension test specimens, shall be in accordance with Fig. 3.

³ The sole source of supply of the Forney capping compound melting chamber, Model LA-0130, known to the committee at this time is Forney Industries, Inc., 1565 Broadway Ave., Hermitage, PA 16148. If you are aware of alternative suppliers, please provide this information to ASTM Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee,¹ which you may attend.
