

Designation: C950/C950M – 08 (Reapproved 2023)

Standard Practice for Repair of a Rigid Cellular Polyurethane Insulation System on Outdoor Service Vessels¹

This standard is issued under the fixed designation C950/C950M; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This practice covers the repair of spray-applied polyurethane insulation on vessels normally operating at temperatures between -30 and $+107^{\circ}\text{C}$ [-22 and $+225^{\circ}\text{F}$].

1.2 **Warning**—At temperatures below 0°C [32°F] the application of a spray “foam” directly onto the cold substrate may not be possible. The term “foam” applies to spray-applied polyurethane or polyisocyanurate (PUR or PIR) rigid cellular plastic only, and not to any other plastic insulation.

1.3 The values stated in either SI units or inch-pound units are to be regarded separately as standard. The values stated in each system may not be exact equivalents; therefore, each system shall be used independently of the other. Combining values from the two systems may result in non-conformance with the standard.

1.4 *This standard may involve hazardous materials, operations, and equipment. This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety, health, and environmental practices and determine the applicability of regulatory limitations prior to use.* For a specific precautionary statement see 1.2.

1.5 *This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.*

C945 Practice for Design Considerations and Spray Application of a Rigid Cellular Polyurethane Insulation System on Outdoor Service Vessels

3. Terminology

3.1 *General*—Definitions included in Terminology C168 shall apply to the terms used in this practice.

4. Surface Preparation

4.1 All damaged or nonadhering foam shall be removed to the substrate in all directions, until dry, solidly adhering foam is encountered.

4.2 The remaining foam insulation shall be beveled on all sides to approximately a 45° angle.

4.3 The substrate shall be examined and if the existing primer is damaged, it shall be wire-brushed and reprimed, where feasible, in accordance with the primer manufacturer's instructions.

4.4 A covering shall be installed around the area to be repaired, prior to spray foam application, to protect the surrounding undamaged area from overspray and removed after completion of the repair work.

5. Repair Procedure

5.1 The repair shall be accomplished in one of the following manners:

5.1.1 Foam shall be spray applied to the prepared area and top-coated with the specified protective coating. (An open-weave reinforcing fabric may be embedded into the wet first coat if desired. Caution shall be taken to embed the reinforcing fabric totally within the coating.)

5.1.2 For substrate temperatures below 0°C [32°F], the following procedure shall be used: Cut to shape and install a thin layer of rigid PUR/PIR board (to insulate the surface) in the prepared area with a joint sealer. Apply spray foam in accordance with 5.1.1.

5.2 All horizontal areas shall be repaired in a manner to provide drainage and prevent free-standing water.

5.3 Spraying shall not be done in the presence of water (rain, fog, condensation, etc.) or wind velocities greater than 15
