

Designation: D5970/D5970M – 16 (Reapproved 2021)

Standard Test Method for Deterioration of Geotextiles from Outdoor Exposure¹

This standard is issued under the fixed designation D5970/D5970M; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This test method covers evaluating the deterioration in tensile strength and strain after outdoor exposure.

1.2 The deterioration is assessed as a reduction in strength and strain at failure from the unexposed geotextile.

1.3 The specific location of the light and weather exposure is made on the basis of a site-specific decision between the parties involved.

1.4 The values stated in either SI units or inch-pound units are to be regarded separately as standard. The values stated in each system are not necessarily exact equivalents; therefore, to ensure conformance with the standard, each system shall be used independently of the other, and values from the two systems shall not be combined.

1.5 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety, health, and environmental practices and determine the applicability of regulatory limitations prior to use.*

1.6 *This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.*

G113 Terminology Relating to Natural and Artificial Weathering Tests of Nonmetallic Materials

3. Terminology

3.1 For definitions of terms related to geosynthetics, refer to Terminology **D4439**.

3.2 For definitions of terms related to weathering, refer to Terminology **G113**.

3.3 Definitions:

3.3.1 *ultraviolet degradation*—the photochemical change induced by exposure to ultraviolet radiation that results in deterioration of the performance characteristics of the polymeric structure.

3.3.2 *weathering degradation*—the change induced by exposure to outdoor conditions that results in deterioration of the performance characteristics of the polymeric structure.

4. Summary of Test Method

4.1 Geotextile coupons are attached to a test frame oriented 45° from the horizontal and facing the equator at a designated location for exposure times of 1, 2, 4, 8, 12, and 18 months. Exposure shall begin so as to ensure that material is exposed during the maximum intensity of ultraviolet light of the year. Unless otherwise specified, the test should be initiated in May in the northern hemisphere, and in November in the southern hemisphere.

4.1.1 Unexposed coupons, or 'file specimens' according to Terminology **G113**, shall be retained for testing.

4.2 After each exposure time, the appropriate coupons are brought into a laboratory for strength determination. The results of these tests are compared to the strength determined for the unexposed coupons. The user may be interested in exposure times other than specified in this test method. These times should be noted in reporting the results.

4.3 The results are presented in the form of various plots.

4.4 Additional recommendations may be found in Practice **G7/G7M** and Terminology **G113**.

5. Significance and Use

5.1 Outdoor exposure tests at one location may not be applicable to a project site at another location. This test method
