Designation: E2848 – 13 (Reapproved 2023)

An American National Standard

Standard Test Method for Reporting Photovoltaic Non-Concentrator System Performance[1]

This standard is issued under the fixed designation E2848; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This test method provides measurement and analysis procedures for determining the capacity of a specific photovoltaic system built in a particular place and in operation under natural sunlight.

1.2 This test method is used for the following purposes:

1.2.1 Acceptance testing of newly installed photovoltaic systems,

1.2.2 Reporting of dc or ac system performance, and

1.2.3 Monitoring of photovoltaic system performance.

1.3 This test method should not be used for:

1.3.1 Testing of individual photovoltaic modules for comparison to nameplate power ratings,

1.3.2 Testing of individual photovoltaic modules or systems for comparison to other photovoltaic modules or systems, and

1.3.3 Testing of photovoltaic systems for the purpose of comparing the performance of photovoltaic systems located in different places.

1.4 In this test method, photovoltaic system power is reported with respect to a set of reporting conditions (RC) including solar irradiance in the plane of the modules, ambient temperature, and wind speed (see Section 6). Measurements under a variety of reporting conditions are allowed to facilitate testing and comparison of results.

1.5 This test method assumes that the solar cell temperature is directly influenced by ambient temperature and wind speed; if not the regression results may be less meaningful.

1.6 The capacity measured according to this test method should not be used to make representations about the energy generation capabilities of the system.

1.7 This test method is not applicable to concentrator photovoltaic systems; as an alternative, Test Method E2527 should be considered for such systems.

1.8 The values stated in SI units are to be regarded as standard. No other units of measurement are included in this standard.

1.9 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety, health, and environmental practices and determine the applicability of regulatory limitations prior to use.*

1.10 *This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.*

3. Terminology

3.1 *Definitions*—Definitions of terms used in this test method may be found in Terminology E772, IEEE 1547-2003, and ISO/IEC Guide 98-1:2009 and ISO/IEC Guide 98-3:2008.

3.2 *Definitions of Terms Specific to This Standard:*

3.2.1 *averaging interval, n*—the time interval over which data are averaged to obtain one data point. The performance test uses these averaged data.

3.2.2 *data collection period, n*—the period of time defined by the user of this test method during which system output power, irradiance, ambient temperature, and wind speed are measured and recorded for the purposes of a single regression analysis.

3.2.3 *plane-of-array irradiance, POA, n*—see *solar irradiance, hemispherical* in Tables G173.

3.2.4 *reporting conditions, RC, n*—an agreed-upon set of conditions including the plane-of-array irradiance, ambient temperature, and wind speed conditions to which photovoltaic system performance are reported. The reporting conditions must also state the type of radiometer used to measure the plane-of-array irradiance. In the case where this test method is to be used for acceptance testing of a photovoltaic system or reporting of photovoltaic system performance for contractual purposes, RC, or the method that will be used to derive the RC, shall be stated in the contract or agreed upon in writing by the parties to the acceptance testing and reporting prior to the start of the test.

3.2.5 *sampling interval, n*—the elapsed time between scans of the sensors used to measure power, irradiance, ambient temperature, and wind speed. Individual data points used for the performance test are averages of the values recorded in these scans. There are multiple sampling intervals in each averaging interval.

3.2.6 *utility grid, n*—see **electric power system** in IEEE 1547-2003.

3.3 *Symbols:* The following symbols and units are used in this test method:

3.3.1 α—reference cell I_{SC} temperature coefficient, $°C^{-1}$

3.3.2 a_1, a_2, a_3, a_4—linear regression coefficients, arbitrary

3.3.3 *a, b, c, d*—spectral mismatch factor calibration constants, arbitrary

3.3.4 *C*—reference cell calibration constant, Am^2W^{-1}

3.3.5 C_o—reference cell calibration constant at SRC, Am^2W^{-1}

3.3.6 *E*—plane-of-array irradiance, W/m^2

3.3.7 E_o—irradiance at SRC, plane-of-array, W/m^2

3.3.8 $E_o(\lambda)$—reference spectral irradiance distribution, Wm^{-2} nm^{-1}

3.3.9 E_{RC}—RC rating irradiance, plane-of-array, W/m^2

3.3.10 $E_{RC}(\lambda)$—spectral irradiance distribution at RC, Wm^{-2} nm^{-1}

3.3.11 $E_T(\lambda)$—spectral irradiance distribution, test light source, Wm^{-2} nm^{-1}

3.3.12 *F*—fractional error in short-circuit current, dimensionless

3.3.13 I_{SC}—short-circuit current, A

3.3.14 *M*—spectral mismatch factor, dimensionless

3.3.15 *p*—p-value, dimensionless quantity used to determine the significance of an individual regression coefficient to the overall rating result

3.3.16 *P*—photovoltaic system power, ac or dc, W

3.3.17 P_{RC}—photovoltaic system power at RC, ac or dc, W

3.3.18 *RC*—reporting conditions

3.3.19 $R_R(\lambda)$—reference cell spectral responsivity, A/W

3.3.20 $R_T(\lambda)$—test device spectral responsivity, A/W

3.3.21 *SRC*—standard reporting conditions

3.3.22 *SE*—standard error, W

3.3.23 T_a—ambient temperature, °C

3.3.24 T_{RC}—RC rating temperature, °C

3.3.25 U_{95}—expanded uncertainty with a 95 % coverage probability of photovoltaic system power at RC, W

3.3.26 λ—wavelength, nm

3.3.27 *v*—wind speed, m/s

3.3.28 v_{RC}—RC rating wind speed, m/s
