### **5.12 Thermal time constant by ambient temperature change ( $\tau_a$ )**

*Replace with this new subclause 5.12:*

### **5.12 Thermal time constant by ambient temperature change ( $\tau_a$ )**

#### **5.12.1 The hot to cold thermal time constant for ambient temperature change**

##### **5.12.1.1 General**

The method of test shall be as described below.

##### **5.12.1.2 Initial measurements**

The zero-power resistance shall be measured as prescribed in 5.6 at the temperature  $T_i$  followed by the same measurement at  $T_a$ . The temperature  $T_i$  is calculated as follows:

$$T_i = T_b - (T_b - T_a) \times 0,632$$

where

$T_b$  is (273,15 + 85) K, unless otherwise specified in the detail specification;

$T_a$  is (273,15 + 25) K, unless otherwise specified in the detail specification.

Measurements shall be recorded.

##### **5.12.1.3 Preconditioning**

The thermistor shall be immersed in a medium with a temperature  $T_b$  and allowed to reach the medium temperature.

#### 5.12.1.4 Test methods

The thermistor shall be transferred rapidly to a medium with a temperature  $T_a$ . The time it takes for the thermistor to reach the zero-power resistance at  $T_i$  shall be measured.

The resulting time is the thermal time constant by ambient temperature change.

#### 5.12.2 The cold to hot thermal time constant for ambient temperature change

##### 5.12.2.1 General

The method of test shall be as described below.

##### 5.12.2.2 Initial measurements

The zero-power resistance shall be measured as prescribed in 5.6 at the temperature  $T_i$  followed by the same measurement at  $T_a$ . The temperature  $T_i$  is calculated as follows:

$$T_i = T_a + (T_b - T_a) \times 0,632$$

where

$T_b$  is (273,15 + 85) K, unless otherwise specified in the detail specification;

$T_a$  is (273,15 + 25) K, unless otherwise specified in the detail specification.

Measurements shall be recorded.

##### 5.12.2.3 Preconditioning

The thermistor shall be immersed in a medium with a temperature  $T_a$  and allowed to reach the medium temperature.

##### 5.12.2.4 Test methods

The thermistor shall be transferred rapidly to a medium with a temperature  $T_b$ . The time it takes for the thermistor to reach the zero-power resistance at  $T_i$  shall be measured.

The resulting time is the thermal time constant by ambient temperature change.

#### 5.12.3 Final measurements and requirements

The thermal time constant by ambient temperature change shall be within the limits specified in the detail specification.

#### 5.12.4 Requirements

The medium used in 5.12.1.2, 5.12.1.3, 5.12.2.2 and 5.12.2.3, the temperature tolerance on  $T_a$  and  $T_b$ , air (flow rate) or liquid (flow rate and viscosity) shall be defined in the detail specification.

NOTE This method is not suitable for miniature thermistors because the change of temperature during transfer from the first to the second medium can lead to a considerable measuring error.
