
**Light-gauge metal containers — Round
open-top cans — Internal diameters**

*Réipients métalliques légers — Boîtes rondes serties — Diamètres
intérieurs*

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

International Standard ISO 1361 was prepared by Technical Committee ISO/TC 52, *Light gauge metal containers*, Subcommittee 4, *Open-top containers*.

This fourth edition cancels and replaces the third edition (ISO 1361:1983), in which the following technical changes have been made:

- nearly all dimensions and tolerances of the actual internal body diameters have been slightly changed to reflect the most current practice ;
- nominal necked-in diameters are included which, associated with the internal body diameters, allow the stacking of three-piece cans ;
- the following diameters, which were considered acceptable until the end of 1987, are deleted :

56; 57; 61; 70; 71; 72; 93; 100; 109; 113; 126; 135; 138; 154 ;
- a new list of diameters which are acceptable for a five-year period has been drawn up.
