

Building construction — Modular coordination — System of preferred numbers defining multimodular sizes

Construction immobilière — Coordination modulaire — Système de nombres préférentiels définissant les dimensions multimodulaires

ISO (International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work.

The main task of ISO technical committees is to prepare International Standards. In exceptional circumstances a technical committee may propose the publication of a technical report of one of the following types :

- type 1, when the necessary support within the technical committee cannot be obtained for the publication of an International Standard, despite repeated efforts;
- type 2, when the subject is still under technical development requiring wider exposure;
- type 3, when a technical committee has collected data of a different kind from that which is normally published as an International Standard ("state of the art", for example).

Technical reports are accepted for publication directly by ISO Council. Technical reports types 1 and 2 are subject to review within three years of publication, to decide if they can be transformed into International Standards. Technical reports type 3 do not necessarily have to be reviewed until the data they provide is considered no longer valid or useful.

ISO/TR 8389 was prepared by Technical Committee ISO/TC 59, *Building construction*.

The reasons which led to the decision to publish this document in the form of a technical report type 2 are explained in the Introduction.

0 Introduction

An attempt to develop a system of preferred modular sizes in building has been discussed since 1970.

The very idea of this subject has been challenged as unrealistic, since nearly every ISO member body involved in the discussions has its own theory of preferred modular sizes.

Real progress was first achieved when it was decided to draw up two draft documents:

- a) a purely theoretical one, dealing only with numbers arranged in theoretical orders in an unlimited system (this document), and

- b) a draft International Standard containing a limited series of multimodular sizes arranged in series based on an earlier choice of multimodule.

At the ISO/TC 59/SC 1 meeting in May 1977 it was decided that the numerical system should be presented in a technical report.

The reasons for this decision were

- a) Some committee members found that the theoretical approach had no practical purpose, for which reason they want it to be guidelines to other standardizers only.
- b) Some committee members found that the time was not ripe for introducing such an advanced system of guidance.
- c) Looking upon the system as a practical means of control in decentralized development, some members whose countries are highly industrialized in this field would have liked it to become a standard.

The final compromise of these conflicting viewpoints was to issue the document as a technical report in order to inform interested specialists of its content.

The rationale for the choice of this system, together with the reasons for which it has not been based on the series of preferred numbers given in ISO 3, *Preferred numbers — Series of preferred numbers*, is explained in the annex.

1 Scope

This technical report establishes a system of preference for numbers for use as the numerical factor in multimodular sizes especially for horizontal dimensions in building, and guidance for its use.

2 Field of application

This technical report is applicable to buildings of all types designed in accordance with the principles and rules of modular coordination as laid down in ISO 2848.

As the system is based on the number 3 and its multiples and as the flexibility in relation to halving and doubling of sizes is the main principle of the system, it is primarily suitable for horizontal dimensions.

4 Definitions

For the purposes of this technical report, the definitions given in ISO 1791 are applicable.

5 System

5.1 Values

The entire system includes all multiples of 3 arranged in doubling series. The doubling series are arranged as follows:
